# **POST-TENSIONING SYSTEMS CIVIL ENGINEERING CONSTRUCTION** 1-1-

CCL extends the limits of construction techniques used to enhance the built environment. At CCL, the Company works to improve the performance of construction allowing its partners to design and build more efficient and durable structures, more rapidly, for the benefit of individuals and the community.

# CCL multistrand systems...

### CCL EXPERIENCE

CCL has a reputation for the design, manufacture, supply and installation of innovative, world-class post-tensioning systems. Working for clients across the world, CCL has the experience and a proven ability to create solutions that help reduce timescales and deliver exceptional results.

### **CCL QUALITY**

Dedicated to a programme of continuous research and development, CCL provides an exceptional service tailored to local and regional conditions and regulations. The Company operates a Quality Management System that complies with BS EN ISO 9001 and all products are manufactured to exacting standards using high specification materials. CCL uses the latest software and finite element analysis for all product design and development. CCL products are approved and tested to the latest ETAG and AASHTO requirements.

### CCL COMMITMENT

Involved in projects from conception, CCL offers assistance to help clients meet the requirements of the structure and local technical standards. The Company adds value throughout the project in terms of design, construction, systems, equipment and implementation. CCL has a reputation for delivering a responsive, flexible, cost-effective service and high quality civil engineering solutions worldwide.

### CCL SERVICE

CCL operates a fully integrated supply chain through its own group companies to ensure quality from conception to construction and beyond. Its local companies and licensees have access to the CCL engineering, research and development, construction and supply resources to offer an optimal solution suited to the local market.

CCL's global presence, experience and expertise enables the Company to offer clients a local solution backed by international engineering and construction techniques. CCL's philosophy is simple: to offer the client the best solution in terms of design, supply and construction for their market and project.

# strand...

The strand used in CCL Post-tensioning Systems is manufactured from seven cold drawn wires and is termed a '7 wire prestressing strand'. It has a straight central wire, called a core or king wire, around which six wires are spun in one layer. The outer wire is tightly spun around the central wire with a lay length between 14 and 18 times the nominal strand diameter. The diameter of the central wire is at least three per cent greater than the diameter of the outer helical wires. Strands are supplied to site typically in 3-4 tonne coils.

# XM range...

CCL's world-class product development ensures that the specification and mechanical properties of the CCL XM Multistrand Post-tensioning range are second to none. Versatile, lightweight and compact, but immensely strong, CCL's range of bespoke and standard systems gives engineers and contractors the flexibility they need to deliver cuttingedge contemporary structures on time and within budget.

The type of anchorage is designated by type and size in the following order:

Live End / Dead End

### Example:

XM-60-19-15.7-L – Live End Multistrand Anchorage with a size 60 Force Transfer Unit having 19 strands of Ø15.7mm.

# metal ducts...

In order to insert the strands within the structure, a void must be formed in the concrete. The most effective and economical way to do this is to cast metal spiral duct into the concrete at the desired position and profile. After the strands have been stressed, the remaining void in the duct is grouted. This provides corrosion protection and bonds the strands to the duct. The corrugations within the duct provide an excellent bond between the grouted strands and the concrete structure.

### Metal Duct

Corrugated sheaths are made from rolled sheet with a minimum thickness of 0.3mm. The usual guide for the required diameter of duct is 2.5 times the nominal area of the strands encased inside the duct. The recommended number of strands per anchorage is shown on page 5. These should be checked against the local requirements and regulations.

Duct weight is indicative and depends on the sheet thickness and manufacturing process. For coefficient of friction and unintentional angular displacement please refer to page 33.

# plastic ducts...

### Plastic Duct

CCL supplies round plastic duct where enhanced corrosion protection or improved fatigue resistance is required. Manufactured from High-Density Polyethylene (HDPE) or Polypropylene, the duct provides excellent secondary corrosion protection in aggressive environments.

Although supplied typically in 6 metre lengths for ease of transportation, it can be manufactured to specific lengths or coils according to project requirements. It is connected using specific clam shell couplers, with or without integrated grout vents, for ease of installation and to provide secure joints.

The duct meets all applicable requirements of the fib and American DOT regulations.

# XM live end anchorage 13mm & 15mm...

The CCL XM Live End Anchorages are primarily designed for longitudinal tendons in beams or bridges.

Live end anchorages can be used as active or passive anchorages if they are accessible.

The strands of the anchorage are simultaneously stressed by a jack bearing on the force transfer unit by means of a bearing ring.

### System Options

CCL XM Systems are approved to ETAG 013 for use in cryogenic applications, applications requiring plastic duct and those which call for full encapsulation. Contact CCL for a full list of approvals.

All dimensions in mm

\*B is the dimension for the straight part of the deviation cone that links to the duct through a duct coupler \*\*Duct dimensions shown are for inside/outside diameter of metal ducts.

The prestressing force is applied to the strands and locked in place by the wedges in the anchor head which is supported on the force transfer unit cast into the concrete.

The force transfer unit ensures the transmission of the prestressing force into the concrete.

The force transfer unit and the deviation cone ensure the correct deviation of the strands from the anchor head to the duct.

# XM dead end anchorage 13mm & 15mm...

The CCL XM Dead End Anchorage operates as a non-accessible dead end of the tendon. The wedges are locked in place by the spring plate while the prestressing force is applied to the opposite (live) end of the tendon. The prestressing force in the strands is locked by the wedges in the anchor head which is supported on the force transfer unit cast into the concrete.

Non-Accessible Dead End

# XM basket dead end anchorages...

Basket dead end anchorages can be used in place of standard dead end anchorages. The prestressing force is transferred to the concrete by bond. A rebar net is required to act as a spacer for the individual strands. Basket dead ends are constructed on site using an extrusion rig.

# XM dead end anchorages...

### Compression Fitted Dead End Anchorage

CCL Dead End Anchorages are used where the end of a prestressing cable is buried in concrete or is inaccessible during the stressing of the tendon. The dead end anchorage can accept the same strand configurations as the standard anchorage and uses the same tube unit to guide the strands. The strand passes through a parallel hole anchor head and is anchored by means of a compression fitting. The fitting is swaged onto the strand, ensuring a positive anchor, using a CCL Extrusion Rig activated by a hydraulic pump. A retaining plate is fixed onto studs in the four tapped holes of the tube unit to ensure that the compression fittings bear evenly on the bearing plate.

### XM Plate Dead End Anchorage

CCL XM Dead End Anchorages are used where prestressing force is required immediately behind the anchorages in inaccessible locations. The anchorages are made by threading plates onto the strands and swaging compression fittings to hold the plates in place. A shorter length of strand is required to develop full prestressing force.

### XM Loop Dead End Anchorage

A further alternative for a dead end in inaccessible locations is the CCL Loop Dead End Anchorage. These are used in slabs, bridges, tanks and in vertically post-tensioned elements in walls and piers. The duct is placed in the formwork prior to concreting and the strands are installed after casting of the concrete. Both ends of the strands are stressed simultaneously.

Other numbers of strands can be accommodated. Please contact CCL for advice.

# XM coupler anchorage...

## XM Coupler

In continuous bridge deck construction, it is necessary to extend prestressing cables as construction proceeds. The first stage of stressing is carried out in the same way as with the standard anchorage except that a coupler ring replaces the anchor head.

When first stage stressing and grouting is complete, the second stage strands are threaded into the wedges. The strand is deviated through a shaped trumpet that also prevents the ingress of concrete during casting.

# coupler anchorages...

### **Compression Fitting Couplers**

As an alternative to the standard coupler using wedges, a system with compression fittings can be provided. In addition to the standard live end anchorage it incorporates a cast coupler ring, which is inserted between the anchor head and the force transfer unit. The coupler ring incorporates slots to accommodate the compression fittings which are swaged to the strands of the second stage cable using an extrusion rig.

The strand is deviated through a shaped trumpet that also prevents the ingress of concrete during casting. A grout exit point contained in the trumpet should be located at the top to prevent any air being trapped during grouting. The small end of the trumpet should be securely taped to the duct.

### Moveable Couplers

CCL Moveable Couplers use a special double-ended joint to connect the second stage of the tendon to the first. The special double-ended joints are extremely slim and use internal wedges to grip the strand. Unique safety pegs are used to ensure that the wedges grip the strand securely when fitting. The moveable couplers are staggered to allow for a very compact section. The assembly is contained within a steel or high-density polyethylene shroud. The double-ended joints can also be used to join monostrand systems or multistrand systems by coupling each strand individually.

# XF live end anchorages...

## CCL Bonded Flat System

The CCL XF Anchorage is a flat system used mainly in slabs and transversally in bridge decks. It can also be used in transfer beams, containment structures and other civil applications and for both 13mm and 15mm strands. The system connects bare strands which run through a steel or plastic flat oval duct. The strands are stressed individually using a monostrand Jack.

### System Options

CCL XF Systems are approved to ETAG 013 for use in applications requiring plastic duct and those which call for full encapsulation. Contact CCL for a full list of approvals.

All dimensions in mm.

\*Dimension E is the distance the anchor head protrudes from the force transfer unit (FTU).

Overall thicknesses of 13mm and 15mm anchor heads are 40 and 45mm respectively.

Special 13mm wedges in 15mm form can be provided to allow 15mm systems to be used with 13mm strand.

It is possible to use CCL XF Anchorages with a number of strands fewer than the maximum number specified. In this case, strands are omitted from the standard anchor head.

# XU anchorages...

### XU Live End Anchorages

The CCL Unbonded System is designed to work with both 13mm and 15mm nominal diameter strands. On completion of the stressing, the strand is cropped and the strand end and wedge are sealed with a grease filled plastic cap.

XU Live End Dimensions												
Anchorage	Anchorage A B C D ØE ØF G											
XU-13	153	73	110	63	62	106	62					
XU-15	184	81	150	78	65	106	62					

All dimensions in mm.

The wedges are available in three different sizes; 13mm, 15.2mm and 15.7mm.

Special 13mm wedges in 15mm form can be provided to allow 15mm systems to be used with 13mm strand.

# XU anchorages...

The CCL XU System is a monostrand system mainly used in slabs. It can also be used in containment structures and remedial applications. The anchorages can be used for both 13mm and 15mm strands. The system connects to unbonded strands, therefore eliminating the need for duct. In some cases it is used as a monostrand bonded system or as a dead end system on multistrand applications. The strands are stressed individually using a monostrand Jack.

# XT anchorages...

### XT Anchorage

These anchorages are predominately used on circular containment structures such as tanks, reservoirs, silos etc. and are stressed using monostrand jacks. The design allows the tendon to anchor the live end of the anchorage against the passive end, so acting also as a coupler anchorage. The body of the item is cast in a single unit to provide a compact self-contained anchorage.

# external post-tensioning...

External post-tensioning is an increasingly popular method of strengthening both new and existing structures. It can be used to extend the life of old structures including bridges, car parks, factories and residential buildings and is a highly cost-effective alternative to traditional internal post-tensioning in new structures.

In response to requirements to inspect and or replace tendons, an external post-tensioning system can be used.

External tendons reduce congestion in concrete and offer a high degree of corrosion resistance whilst allowing inspection and in some cases replacement. Friction losses are also kept to a minimum as they occur only at the deviators and anchorage points.

Deviators at intermediate points normally take the form of steel pipes curved to a radius.

All dimensions in mm

Concrete strengths shown are cylinder test strength/cube test strength.

Smaller centre to centre dimensions can be achieved. Contact CCL for advice.

For values of  $f_{cm,0}$  between C25/30 and C45/55, A and B can be determined by straight line interpolation. The mean compressive strength of concrete at which full

prestressing is permitted, f<sub>cm,0</sub> specified by the designer of the structure, must be greater than or equal to C25/30. In the case of partial stressing of a standard anchorage to 50% of Fpk, the minimum mean compressive strength of concrete could be reduced by 30%. The table above is based on the requirements of ETAG 013 and typical concrete strengths. For CCL recommendation and full design rules outside the above please contact CCL for advice.

\*\* If anchors are placed in individual pockets, dimensions shown work with smallest jack option of P25. If larger jacks are used, dimensions need to be adjusted in accordance with P25.

All dimensions in mm except where stated.

\* If anchors are placed in individual pockets, dimensions on P24 must be adjusted to meet dimension F or larger. Otherwise, smallest jack option should be used.

# jack sizes...

CCL MG Jacks are simple to operate and easy to manoeuvre. The body of the jack can be rotated around its lifting points, enabling easy access to hydraulic connections. The jack innards can also be rotated, promoting easy alignment with the tendons. CCL Jacks may be operated in a vertical or horizontal position and feature hydraulic lock-off to ensure the correct seating of the wedges and to minimise load losses at transfer.

# The CCL MG Stressing Jacks used for the CCL XM System have the following features:

- Automatic gripping of the wedges on the strands
- Simultaneous stressing of all the strands of the tendon
- Support of the jack on the force transfer unit, by means of a temporary bearing ring
- Simultaneous hydraulic lock-off of all the wedges in the anchor head
- Partial stressing of the tendons with later recovery up to the final values of the prestressing force
- Stressing by successive loadings of the jack when the final extension is greater than the full stroke of the CCL Jack
- Different jack innards requirement for each system size

# MG Jack Dimensions

Jack Size	А	В	C*	Ø D	Ø E	ØF	G	H** min	Weight
1800MG	322	388	210	256	232	342	426	760	275kg
3000MG	290	388	200	280	270	405	500	700	350kg
4000MG	307	415	210	344	360	490	585	730	575kg
6000MG	304	462	209	386	410	576	680	766	700kg
7500MG	321	480	220	478	490	652	760	850	1150kg

All dimensions in mm.

\* Stroke of jack.

\*\* Minimum length of strand.

# stressing options...

There are two versions of innards available for the MG jack series, manual and auto release. The standard CCL MG Jack is fitted with manual innards. Auto release innards are included on the CCL MGA Jack. They are also available as a retrofit option via a separate kit compatible with the standard MG jack\*. The auto release innards make the stressing process quicker and easier by eliminating the need to manually install / remove the jack wedges.

### **CCL Stressing Sequence**

1. Place the anchor head onto the strands, ensuring that the centre mark is at the top. Fit the wedges into the anchor head, then fit the bearing ring and lock-off plate.

2. Thread the jack onto the strands. A suitable lifting device should support the weight of the jack.

3. Push the jack up to the anchorage. For jacks without auto release innards, insert the jack wedges into the pulling plate inside the rear of the jack.

4. All stressing operations are controlled from the pump unit to ensure the operator's safety. Carry out stressing, lock-off and retraction. The lock-off pushes the lock-off plate forward, which seats the anchorage wedges firmly into the anchor head.

# Jack Selection Table

Anchorage	No. Strands 13mm	No. Strands 15mm	1800MG	3000MG	4000MG	6000MG	7500MG
XM-10	4	3					
XM-20	6	4	<b>1</b>				
XM-30	9	7	<b>1</b>	<b>1</b>			
XM-35	12	9		<b>1</b>

XM-60	27	19			<b>1</b>	<b>1</b>	**
XM-70	31	22					**
XM-75	37	25					**
XM-80	40	27					**
XM-90	46	31					
XM-95	51	35					
XM-100	55	37					<b>1</b>

\* Minor modification is required – contact CCL for further details

\*\* If anchors are placed in individual pockets, dimensions on P24 work with smallest jack option.

# monostrand jacks...

### Hollowram Jack Series

CCL Hollowram Jacks have a compact, lightweight design and are intended for site use with the CCL SRL and SRX series pumps. They are designed to stress the XF and XU anchorages. The noses of the jacks can be changed easily to suit different applications. The standard HR jack is equipped with mechanical lock-off and the HRL jack is equipped with hydraulic lock-off. The type of jack for each application can be taken from the table below.

### HR Jack

### HRL Jack

# Hollowram Jack Clearance

Jack	Anchorage	Ø Strand	А	В	С	D	E Stroke	Total Clearance*
250kN HR	XF	13	220	415	100	70	190	925
250kN HR	XF	15	220	415	100	70	190	925
250kN HR	XU	13	175	370	100	70	190	835
250kN HR	XU	15	175	370	100	70	190	835
250kN HRL	XF	13	275	775	100	70	190	1340
250kN HRL	XF	15	335	830	100	70	190	1455
250kN HRL	XU	13	250	745	100	70	190	1285
250kN HRL	XU	15	255	750	100	70	190	1295

All dimensions in mm.

\*Total clearance shown is based on jack stroke. Lower clearance is needed if elongation is less than the stroke.

# stressing sequence...

- 1. After removal of formwork the anchor head and wedges are threaded onto the strands.
- 2. Using the correct jack and nose combination with calibrated pump / gauge, the jack is threaded onto the strands and pushed up to the anchor head.
- 3. All stressing operations are controlled from the pump unit to ensure the operator's safety. The jack is extended and when the load is reached, the jack lock-off system is applied which firmly seats the wedge into the anchor head.
- 4. The jack is then retracted and the wedge released so the jack can be removed when the full load is reached, or the operation can be repeated until the required load is achieved.

# XF SEQUENCE

If missing out a strand it should be considered that the following should be omitted:

XF-10-3-13 Position 1 XF-20-5-13 Position 3 XF-30-6-13 Position 3 XF-10-2-15 Position 2 XF-20-4-15 Position 2 XF-30-5-15 Position 3

# stressomatic jacks...

The primary items of equipment in the XF and XU operations are the CCL Stressing Jacks. The noses of the jacks can be changed to suit various applications and feature automatic gripping and lockoff on the strand. All jacks need to be calibrated to a pump before use. The jacks can be used for partial stressing and successsive loading if necessary. The type of jack for each application can be taken from the table below.

# Stressomatic Jack Clearance

Jack	Ø Strand	А	В	С	D	E Stroke	Total Clearance*
160kN Short Stroke	13	225	755	200	60	205	1385
160kN Long Stroke	13	225	1085	200	60	535	2045
300kN Short Stroke	13/15	350	860	200	70	205	1615
300kN Long Stroke	13/15	350	1070	200	70	410	2030

All dimensions in mm.

\*Total clearance shown is based on jack stroke. Lower clearance is needed if elongation is less than the stroke.

# Stressomatic Jack Part Numbers

Jack	Weight Kg	XU13	XU15	XF13	XF15
160kN Jack Short Stroke (Inc Nose Assembly Plunger)	29	106420		106421	
160kN Jack Long Stroke (Inc Nose Assembly Plunger)	41	106430	-	106431	-
300kN Jack Short Stroke (Inc Nose Assembly Plunger)	50	-	107420		107421
300kN Jack Long Stroke (Inc Nose Assembly Plunger)	58	-	107430	-	107431

Specific noses are required to stress the XU or XF systems.

# Stressomatic Jack Nose Part Numbers

Jack	XU13	XU15	XF13	XF15
160kN Jack Nose Assembly Plunger	106190		106109	
300kN Jack Nose Assembly Plunger		107190		107122

# CCL pump units...

CCL Pumps deliver multiple pressures to speed up the stressing operation while maintaining control for precise stressing when needed. Pumps can be supplied in various voltages with analogue or digital readouts.

### SR5000 Pump

SR5000 pumps are heavy duty pumps to power MG Multistressing Jacks. They are specifically designed for site work and the high demands required to stress multiple strands simultaneously.

Pump	Weight Kg	Part No.
Multi Pump High Speed 380/415V 3Ph 50Hz	256	114005

### SR3000 Pump

SR3000 pumps are of a robust design and come complete with a protective frame as standard. The high build quality and specifications of the parts used ensure reliability and a low maintenance life for the unit.

Pump	Weight Kg	Part No.
SR3000 PT 110V 3Ph 50Hz	125	170100
SR3000 PT 220/240V 3Ph 50Hz	125	170101
SR3000 PT 380/415V 3Ph 50Hz	125	170102

### SRX Pump

SRX pumps are designed as a compact lightweight alternative to the SR3000 unit and are capable of delivering excellent performance on small strand diameters. Supplied in various voltages this pump is ideal for site work.

Pump	Weight Kg	Part No.
SRX Pump 110V 3Ph 50Hz with Analogue Gauge	62	171000
SRX Pump 220/240V 3Ph 50Hz with Analogue Gauge	62	171003
SRX Pump 415V 3Ph 50Hz with Analogue Gauge	62	171002

### SRL Pump Series

SRL pumps have an ultra compact and lightweight design and are intended primarily for site use with the CCL Monostrand Jacks. The standard SRL pump can be used with the CCL HR Jack. The SRLL pump equipped with hydraulic lock-off function is compatible with CCL Stressomatic and CCL HRL Jacks.

# installing and grouting...

## **CCL Strand Installation**

For internal prestressing the ducts are placed prior to concreting.

The strand is delivered to site in coils and placed in special dispensers to prevent it from uncoiling.

Before or after concreting, strands are pushed or winched into the duct from one end and cut to length. The installation method depends on the length of the tendon and access conditions.

## **Threading Bullets**

Special threading bullets are fixed to the leading end of the strand (in the case of pushing) to ease the passage of the strands through the duct. Using CCL Strand Pushers the pushing can be controlled from both ends of the tendon (using remote controls) ensuring a safe and efficient operation.

## **CCL** Grouting

The durability of any post-tensioning is affected by the quality of the grouting operation. The grout, as well as providing a bond between the concrete and the tendon, provides long-term corrosion protection for the steel strand.

If the grouting is not carefully controlled and undertaken by experienced professionals, it will compromise the structure and affect its lifespan.

Grouting is undertaken through the anchor using special threaded fittings and valves to ensure a clean and effective grouting operation. Intermediate vents are created along the tendon using grout saddles.

# friction losses...

In post-tensioned concrete, the effect of friction between strands and sheathing during stressing is a major factor in the loss of prestress.

There are three main causes of friction loss in the post-tensioned tendon:

- Friction due to the deviation of the tendon through the anchorage
- Friction between the tendon and the duct due to unintentional lack of alignment (or wobble) of the duct
- Friction due to the curvature of the duct

Friction loss in CCL XM Anchorages determined from testing is 2% to 3%.

### Wedge Set

After the transfer of load from the jack to the anchorage, the strand and wedges draw a little further into the anchor head. This further movement is known as wedge set or draw-in. The wedge set leads to a loss of tension in the strand which must be taken into account in the loss and elongation calculations. The value for wedge set to be used in the calculations for all active anchorages stressed with jacks with hydraulic lock-off is:

Wedge set = 6mm ± 2mm

### **Duct Friction Loss**

Friction Loss in the duct for post-tensioned tendons can be estimated from:

$$\Delta P_{(x)} = P_{\max} (1 - e^{-\mu(\theta + kx)})$$

### Where:

 $\Delta P_{(x)}$  – Loss of force due to friction

 $P_{\text{max}}$  - Force at the active end during tensioning (after losses within the anchorage)

- θ Sum of the angular displacements over a distance
  x (radians irrespective of direction or sign)
- μ Coefficient of friction between strand and duct (1/radian)
- k Unintentional angular displacement (radians per unit metre)
- Distance along the tendon from the point where the prestressing force is equal to P<sub>max</sub>

NOTE: Some design software and country codes use a term K or k = wobble or unintentional friction (per unit metre). This is taken as  $K = \mu k$ , and the formulae is rearranged to suit.

The values for coefficient of friction and unintentional angular displacement k should be in line with EN 1992 Eurocode 2: Design of Concrete Structures, as shown in the table below.

Application	Duct Type	μ		k	
Аррисаціон		Non-Lubricated	Lubricated	Minimum	Maximum
Internal Prestressing	Corrugated Metal	0.19	0.17	0.005	0.01
	HDPE	0.12	0.10	0.005	0.01
	Steel Smooth Pipe	0.24	0.16	0.005	0.01
External Prestressing	HDPE	0.12	0.10	N/A	N/A
	Steel Smooth Pipe	0.24	0.16	N/A	N/A

When the tendon to be controlled has two active / LE anchorages, i.e. with the tendon being able to be stressed with the jack at both ends, the measurement on site of the friction loss of the tendon is possible by comparing the load applied by one jack to the load measured on the other jack.

A focus on outstanding technical solutions, durable products and practical post completion advice ensures CCL continues to deliver projects on an international basis, helping clients around the world create unique structures.

### **Quality Standards**

CCL is an ISO registered company which operates a quality management system compliant with ISO9001.

The Company's high performance anchorage systems are designed, manufactured and tested to exceed the latest European Standard ETAG 013 and AASHTO.

CCL holds CARES approval for its post-tensioning systems.

All products are CE approved and certified.

CCL was established in 1935 to provide cutting-edge engineering solutions. Since then, the Company has grown and diversified to become one of the world's leading global engineering companies specialising in prestressed concrete technology.

Every day, CCL products and services are used in prestigious building and civil engineering structures across the world. CCL's advanced solutions help engineers, planners and construction companies create visionary structures.

The specifications, information and performance of the products manufactured by CCL and featured in this publication are presented in good faith and believed to be correct. Details may be changed without notice. CCL makes no representations or warranties as to the completeness or accuracy of the information.

Information is supplied upon the condition that the persons receiving same will make their own determination as to its suitability for their purposes prior to use. In no event will CCL be responsible for damages of any nature whatsoever resulting from the use of, or reliance upon, information contained in this document.
