

IBC containers

IBC (*Intermediate Bulk Container*) refers to a portable container intended for the transport and storage of liquid chemicals.

When choosing an IBC container, it is important to take into account the characteristics of the chemicals to be stored and transported in them, the operating conditions, and all safety regulations and standards. We always pack and deliver chemicals in UN-approved IBC containers suitable for the substances in question.

To reduce packaging waste, we also deliver chemicals in refillable containers. These can be owned by the customer or by us. We use two types of containers and select the most suitable option together with the customer.

SAFETY CONSIDERATIONS WHEN USING IBC CONTAINERS

- The top cap and/or vent cap must be opened before emptying.
- The equipment used for emptying must be clean.
- Do not add or store other substances in the container, not even water.
- Product labels must not be removed or covered.
- No other labels may be added to the containers.
- The shipping tag must not be attached on top of the product label.

RETURNING IBC CONTAINERS

We kindly ask that you return any IBC containers owned by Algol Chemicals as soon as possible after use. The container to be returned must be intact, empty and clean. Caps, plugs and connections must be closed. The discharge/unloading valve cap must also be in place.

IBC containers can be returned to Turku or Rauma. The return address is marked on the shipping tag on the IBC container.

You can easily order pickup of IBC containers by scanning the QR code on the label and filling out the pickup order form that opens, or by sending the pickup and container information by e-mail to kuljetustilaukset@algol.fi.

PICKUP FORM:

If you arrange return transport yourself, please ensure that the transport documents comply with all regulations.
